

PHASE 5

Project Development

Import Data using Transform Maps (Spreadsheet) — ServiceNow Micro Project

This document is a separate phase report prepared from the supplied original project document. The wording is expanded for clarity while retaining the original project terminology, configurations, steps, and documented results.

Phase Summary

Implements the spreadsheet, custom table, Import Set, Transform Map, field mapping, transformation, and initial validation.

5.1 Spreadsheet Preparation

A new Google Spreadsheet is opened and sample employee data is entered. The spreadsheet is downloaded in Sample Spreadsheet.xlsx format. This file becomes the external source used by the ServiceNow import process.

5.2 Employee Test Table Development

The Employee Test custom table is created through Tables → Create New. After the table is saved, its form is opened and the required fields are configured: Employee ID, Employee Name, Email, Department, and Location. The fields are String type according to the original project.

5.3 Employee Import Development

Under Load Data, an import table is created with the label Employee Import. ServiceNow shows the name as u_employee_import. After submission, the successful creation is checked and the Create Transform Map option is used to continue to the transformation configuration.

5.4 Transform Map Development

The Transform Map is named Sample Spreadsheet Import. Employee Import is used as the source table and Employee Test as the target table. Auto Map Matching Fields and Mapping Assist are used to map the source fields to their corresponding target fields. The mapping is then saved.

5.5 Transformation and Initial Validation

The Transform action is selected and the Transform button is executed. The project checks for a successful status. The Employee Test table is then opened to verify that the imported records have been created. Personalised List Columns can be used to arrange the displayed fields for easier verification.

5.6 Development Result

The initial implementation establishes the complete basic import pipeline. At this point the spreadsheet data can move from the source file into the staging table, through the Transform Map, and into Employee Test, where the records can be inspected.

Configuration / Planning Reference

Development item	Result expected
Spreadsheet	Sample employee data prepared
Employee Test	Custom target table created
Employee Import	Import Set staging table created
Transform Map	Source/target mapping configured
Transform	Import completes successfully
Employee Test records	Imported rows visible

Source Document Alignment

The original project document covers this phase across source pages 6, 7, 8, 9. The expanded text above reorganizes the same documented material into a standalone phase report so that the phase can be submitted or reviewed independently.
